#### Reasons for Allowance

Claims 1-10 remained. Claims 11-17 have been canceled (see page 4 of amendment on 11/04/04).

Upon further review and consideration, none of the prior art of record teaches the combined features of :

a) the application program to insert the execution bits in preceding operation codes which are not used in ones of the plurality of modes , the evaluation of the code prior to the decoding, the skipping of operation al code upon the detection , and decoding the remaining operation codes (claim 1).

#### Prior art of Record

a) Bhat (6,097,955) was cited for the teaching of the skipping of the operational codes (see fig.3, fig.4, col.6, lines 63-67, col.7, lines 1-13, see also servers as software modules in col.5, lines 65-67, col.6, lines 1-15). However, it failed to teach the insertion of the execution bits in preceding operation code, nor the combined features of the insertion of the execution bits in preceding operation codes which are not used , the evaluation of the code prior to the decoding, the skipping of operation al code upon the detection , and decoding the remaining operation codes as claimed.

b) Yamada (5,996,070) was used for supplementing the teaching of the insertion of execution control bit into an instruction field (see col.7, lines 41-60). However, it is directed to the execution bits contained in the same operation code which execution was to be controlled. Furthermore, It did not teach the combined features of the

insertion of the execution bits in preceding operation codes which are not used, the evaluation of the code prior to the decoding, the skipping of operation al code upon the detection, and decoding the remaining operation codes as claimed.
